

Model Comparison Report					
Fit and error measures					
Model	Accuracy	F1	Accuracy_Bike	Accuracy_Car	Accuracy_Public Transportation
FM_Transportation	0.8497	0.8999	0.9753	0.8184	0.9060
<p><b>Model:</b> model names in the current comparison.</p> <p><b>Accuracy:</b> overall accuracy, number of correct predictions of all classes divided by total sample number.</p> <p><b>Accuracy_[class name]:</b> accuracy of Class [class name] is defined as the number of cases that are <b>correctly</b> predicted to be Class [class name] divided by the total number of cases that actually belong to Class [class name], this measure is also known as <i>recall</i>.</p> <p><b>AUC:</b> area under the ROC curve, only available for two-class classification.</p> <p><b>F1:</b> F1 score, <math>2 * \text{precision} * \text{recall} / (\text{precision} + \text{recall})</math>. The <i>precision</i> measure is the percentage of actual members of a class that were predicted to be in that class divided by the total number of cases predicted to be in that class. In situations where there are three or more classes, average precision and average recall values across classes are used to calculate the F1 score.</p>					
Confusion matrix of FM_Transportation					
	Actual_Bike	Actual_Car	Actual_Public Transportation		
Predicted_Bike	79	36	1		
Predicted_Car	0	658	24		
Predicted_Public Transportation	2	110	241
